NZ Update on development of identification guide for benthic bycatch

New Zealand

South Pacific Regional Fisheries Management Organisation

11th Meeting of the Scientific Committee

Panama City, Panama, 11-16 September 2023

**Update on development of the identification guide
for benthic bycatch**

1. Purpose

The purpose of this paper is to provide an update on the SC multi-annual workplan subtask to develop an ID guide for benthic bycatch, following the steps proposed in [SC9-DW12](#). It is intended that this work will enable fishers, observers and researchers to recognise benthic bycatch taxa more readily, and to improve the quality of benthic bycatch records from the SPRFMO Convention Area.

2. Background

Accurate taxonomic identification of invertebrate bycatch samples from commercial bottom fishing vessels is important in determining if taxon-specific threshold weights and biodiversity thresholds have been exceeded, triggering the encounter protocol within SPRFMO [CMM03-2023](#) (Bottom fishing). Improved identification of benthic invertebrates is also important for informing predictive habitat suitability and abundance models, spatial planning processes and the development of ecological risk assessments of fishing impacts on benthic habitats.

At the Deepwater workshop held in 2021 (SCW13), New Zealand presented [SC9-DW12](#), which proposed the development of a pictorial guide for the identification of benthic bycatch. [SC9-DW12](#) proposed 10 steps for the development of the guide to ensure information provided to observers and fishers is standardised, accurate and clear, and pays particular attention to the identification, weighing, photographing, and sampling of benthic bycatch (Table 1).

Following discussion of [SC9-DW12](#), the SC **recommended** “*that the development of ID guide for benthic bycatch, following the steps proposed in this paper, and associated training videos, are added to the SC Multi-annual Work Plan with a 2022+ timeframe*”. Subsequently, COMM10 added a task to the SC multi-annual workplan to “*Develop VME taxa ID guide for benthic bycatch, following the steps proposed in SC9-DW12, and associated training videos*”.

Following COMM10, New Zealand undertook work in 2022 to progress 7 of the 10 steps identified in [SC9-DW12](#). That work included determining the purpose of the ID guides (Step 1), determining which taxa to include in the guide and at what taxonomic resolutions (Steps 2-4), determining what taxon-specific information to include in the guide (Step 5), and determining procedures for subsampling and when subsamples should be collected and returned for expert identification (Steps 7 and 8). At SC10, New Zealand presented [SC10-DW06](#) as a progress report on this work, and sought the SCs endorsement of the appropriateness of the work to date for informing the development of the ID guide. Following review of [SC10-DW06](#), the SC noted that development of an ID guide for benthic bycatch within the SPRFMO Convention Area has been progressed. The SC agreed that:

- i. The purpose of the ID Guide should be to help observers and fishers to identify and collect data on benthic bycatch landed during bottom fishing activities at taxonomic resolutions that are suitable for science and decision-making needs and meet minimum data collection requirements outlined in [CMM02-2022](#) (Data Standards) and [CMM03-2023](#) (Bottom Fishing).
- ii. The list of taxa provided in Annex 2 (of [SC10-DW06](#)) is used to populate the ID guide once Step 4 (determine the taxonomic resolution required to improve data quality and avoid misclassification) has been applied.
- iii. Where species within a genus can be easily distinguished by users in the field, they should be included at the species-level in the ID guide, and where species and genera cannot be readily

distinguished by users in the field, taxa within the guide should be collapsed into higher taxonomic levels.

- iv. The taxon-specific information identified for inclusion in the guide is appropriate.
- v. The instructions for handling, sampling, labelling, and photographing bycatch are appropriate.
- vi. The procedures for when samples should be collected and returned for expert identification are appropriate.

The SC10 advice identified that additional work to develop the ID guide was dependent upon determining the appropriate level of taxonomic classification (to avoid misclassification while being as informative as possible) for each taxon included in Annex 2 of [SC10-DW06](#).

This working paper introduces assessments by taxonomists and para-taxonomists of the taxonomic resolution at which taxa reported in Annex 2 of [SC10-DW06](#) should be included within the ID guide. Additionally, the paper also identifies several additional taxa that should be included within the ID guide, based on their known occurrence within the SPRFMO evaluated area.

Table 1 | Steps for the development of the benthic bycatch ID guide (as proposed in [SC9-DW12](#)), progress to date, associated SC recommendations, and next steps.

Step	Progress	Recommendations from SC10 Report	Next Steps
1. Determine the purpose of the ID guides	Complete	The SC agreed that “ <i>the purpose of the ID Guide should be to help observers and fishers to identify and collect data on benthic bycatch landed during bottom fishing activities at taxonomic resolutions that are suitable for science and decision-making needs and meet minimum data collection requirements outlined in CMM 02-2022 (Data Standards) and CMM 03-2022 (Bottom Fishing).</i> ”	NA
2. Determine which taxa to include	Partially complete	The SC agreed that “ <i>the list of taxa provided in Annex 2 (of SC10-DW06) is used to populate the ID guide once Step 4 (determine the taxonomic resolution required to improve data quality and avoid misclassification) has been applied.</i> ”	This paper, SC11-DW09, presents assessments by taxonomists and para-taxonomists of the taxonomic resolution at which taxa reported in Annex 2 of SC10-DW06 should be included within the ID guide. This assessment is a precursor to progressing steps 5-10.
3. Determine the taxonomic resolution required to inform management	Underway	The SC agreed that “ <i>where species within a genus can be easily distinguished by users in the field, they should be included at the species-level in the ID guide, and where species and genera cannot be readily distinguished by users in the field, taxa within the guide should be collapsed into higher taxonomic levels.</i> ”	
4. Determine the taxonomic resolution required to improve data quality and avoid misclassification	Underway		
5. Determine what taxon-specific information to include	Complete	Having reviewed SC10-DW06, SC agreed that “ <i>the taxon-specific information identified for inclusion in the guide is appropriate</i> ”	Develop taxon-specific ID pages for the guide, once steps 2-4 have been finalized, incorporating information on taxonomic hierarchy, common and scientific names, if the taxon is a VME indicator taxa, FAO reporting codes and reporting codes used by Members or CNCPs, Aphia ID, images, distinguishing features, colour and size information, known distribution and depth, species or genera that can also be commonly confused, as agreed by SC10.
6. Engage with fishers and observers to determine what format and properties the ID guide should have	Underway	-	Ongoing engagement with fishers and observers.
7. Determine procedures for subsampling	Complete	Having reviewed SC10-DW06, SC agreed that “ <i>the instructions for handling, sampling, labelling, and photographing bycatch are appropriate.</i> ”	Incorporate within the guide clear handing instructions for observers and researchers, sample labelling instructions and instructions for the digital collection of photographic images, as agreed by SC10.
8. Determine procedures for when samples should be collected and returned for expert identification	Complete	Having reviewed SC10-DW06, SC agreed that “ <i>the procedures for when samples should be collected and returned for expert identification are appropriate.</i> ”	Incorporate within the guide instructions to collect samples when genera or species- level identification is difficult or uncertain, the specimen has been caught outside its accepted depth range or distribution, it is a rare or unusual specimen, or appears different to the images in ID guides, samples have been specifically requested by the Scientific Committee, a member or CNCP, as agreed by SC10.
9. Expert technical review of ID guides	Not started	-	Commission technical peer review of ID guides once they have been developed.
10. Co-development of ID guides	Underway	-	Ongoing co-development of ID guide through Fisheries New Zealand South Pacific Working Group.

3. Assessment of taxonomic resolution

Taxonomists and para-taxonomists assessed the taxonomic level at which taxa should be included within the ID guide. Due to capacity issues, assessments were not undertaken for Zoantharia, Zoantharia, Hydrozoa within the Order Leptothecata, Bivalves and Gastropoda. Assessments for these taxa will be completed as part of going work.

Assessments by taxonomists and para-taxonomists identified an initial list of 258 taxa to include within the guide, pending the completion of assessments (Table 2 and Annex 1).

Table 2 | For focal taxonomic groups, the number of taxa to be included within the ID guide at each taxonomic level. * denotes VME indicator taxa as designated in Annex 5 of CMM03-2023. [▽]denotes taxonomic groups for which evaluation by taxonomists and para-taxonomists are yet to be completed.

Focal taxonomic group	Taxonomic level				
	Order	Family	Genus	Species	# taxa
Annelida (annelid worms)	0	2	8	2	12
Arthropoda (crabs, shrimp and lobsters)	0	3	15	36	54
Bryozoa (bryozoans)*	0	1	0	0	1
Actiniaria (anemones)*	0	2	3	0	5
Alcyonacea (soft corals)*	0	4	35	4	43
Antipatharia (black corals)*	0	0	17	5	22
Pennatulacea (sea pens)*	0	0	6	4	10
Scleractinia (stony corals)*	0	0	4	8	12
Hydrozoa (hydrozoans) [▽]	-	-	-	-	-
Stylasteridae (hydrocorals)*	0	1	12	1	14
Zoantharia (hexacorals)* [▽]	-	-	-	-	-
Brisingida (armless stars)*	1	0	0	0	1
Astroidea (starfish/sea stars)	0	0	7	17	24
Crinoidea (sea lillies)*	2	3	1	1	7
Echinoidea (sea urchins)	0	3	1	9	13
Holothuroidea (sea cucumbers)	0	0	1	4	5
Ophiuroidea (brittle stars and serpent stars)	0	1	3	5	9
Bivalves [▽]	-	-	-	-	-
Gastropoda [▽]	-	-	-	-	-
Cephalopoda (squid and octopus)	0	0	3	2	5
Demospongiae (sponges)*	0	1	1	9	11
Hexactinellida (sponges)*	1	0	2	7	10

4. Additional taxa to be included in guide

Several additional taxa that should be included within the ID guide, based on their known occurrence within the SPRFMO evaluated area, were identified by taxonomists and para-taxonomists (Annex 1), including:

- The Polychaeta (annelid worm) genus *Hyalinoecia*.
- The Arthropoda (crabs, shrimp, and lobsters) class Pycnogonida, the family Gnathophausiidae, the genera *Eumunida*, *Vitjazmaia*, *Platymaia*, *Vitjazmaia* and *Leptomithrax*, and the species *Trichopeltarion janetae*, *Notopandalus magnoculus* and *Sergia potens*.
- The Bryozoa family Phidoloporidae.
- The Alcyonacea (soft coral) families Clavulariidae and Nephtheidae, the genera *Orstomisis*, *Sclerisis*, *Paragorgia* and *Sibogagorgia*, and the species *Isidoides armata*, *Keratoisis glaesia*, *Keratoisis magnifica*.
- The Antipatharia (black coral) species *Antipathella fiordensis*.
- The Pennatulacea (seapen) genera *Anthoptilum*.
- The Stylasteridae (hydrocoral) genera *Distichopora*, *Inferiolabiata*, *Lepidopora*, *Sporadopora*, *Stephanohelia* and *Systemapora*.
- The Asteroidea (starfish/sea stars) genera *Cheiraster* and *Henricia*, and the species *Crossaster taitai*, *Sclerasterias mollis* and *Pseudechinaster rubens*.
- The Octopoda (octopus) genera *Muusoctopus* and *Graneledone*, and the species *Enteroctopus zealandicus* and *Callistoctopus kermadecensis*.
- The Porifera (sponge) family Cladorhizidae, the genus *Latrunculia*, and the species *Monoraphis chuni*, *Pheronema conicum*, *Euryplegma auriculare*, *Euplectella imperialis*.

5. Next Steps

If the SC agrees that the determination of the taxonomic resolution required to improve data quality and avoid misclassification has been appropriately applied to the taxa assessed to date from the list of taxa provided in Annex 2 of SC10-DW06, and the list of taxa in Annex 1 can be used to begin populating the ID guide, the next steps in developing the ID guide will be to:

- Develop taxon-specific ID pages for the guide, incorporating information on the following, as agreed by SC10:
 - taxonomic hierarchy,
 - common and scientific names,
 - if the taxon is a VME indicator taxa,
 - FAO reporting codes and reporting codes used by Members or CNCPs,
 - Aphia ID,
 - images,
 - distinguishing features,
 - colour and size information,
 - known distribution and depth,
 - species or genera that can also be commonly confused (and associated FAO codes).
- Incorporate within the guide clear handling instructions for observers and researchers, sample labelling instructions, and instructions for the digital collection of photographic images, as agreed by SC10.

- Incorporate within the guide instructions on when to collect samples, as agreed by SC10, including collection of samples when:
 - when genera or species- level identification is difficult or uncertain,
 - the specimen has been caught outside it's accepted depth range or distribution,
 - it is a rare or unusual specimen, or appears different to the images in ID guides,
 - samples have been specifically requested by the Scientific Committee, a member or CNCP.

As these steps are undertaken, ongoing co-development of the ID guide will continue through the Fisheries New Zealand South Pacific Working Group, with technical peer review of ID guides once they have been completed.

6. Recommendations

It is recommended that the Scientific Committee:

- **Notes** that assessments by taxonomists and para-taxonomists of the taxonomic resolution at which taxa reported in Annex 2 of SC10-DW06 should be included within the ID guide has been undertaken, although there remain several taxonomic groups for which assessments are yet to be completed.
- **Agrees** that the list of taxa provided in Annex 1 is used to begin populating the ID guide.

7. Acknowledgements

We thank the following experts for reviewing the taxonomic level at which taxa should be included within the ID guide: Geoff Read (Polychaetes), Karen Schnabel (Arthropods), Jeff Forman (Arthropods), Kate Neill (Asteroids, Pennatulaceans, Pycnogonids), Dennis Gordon (Bryozoans), Sadie Mills (Ophiuroids, Actinarians), Jaret Bilewitz (Octocorals), Rob Stewart (Antipatharians), Jennifer Beaumont (Scleractinians), Peter Marriott (Stylerasterids), Owen Anderson (Crinoids, Echinoids), Niki Davey (Holothuroids), Mark Fenwick (Octopods) and Michelle Kelly (Porifera). We also thank members of the New Zealand South Pacific working group for constructive review and helpful comment on this report.
